Discussion:

Just looked at the NWS KDSM afternoon discussion. The situation continues to focus on possible heavy rain and possible severe weather in the IFLOODS area. The NWS discussion mentions a possible MCS affecting the western fringes of the IFLOODS region by 10-15 Z Sunday, or 5-10 AM local time. Then there will be a break until mid to late afternoon when the next round will occur. In both situations the NWS discussion mentions very high values of precipitable water, and very deep warm cloud layers. Both will provide the support for locally heavy rain, 2+ inches. So flooding is possible along with hail and possible tornadoes (in the late afternoon-evening hours Sunday).
